

# Case Study: PHMSA Readiness

## Background and Challenge

Over the past two years the Pipeline and Hazardous Material Safety Administration (PHMSA), a division of the U.S. Department of Transportation, has enacted regulations and standards mandating corporate documentation of the safe and secure movement of hazardous materials to industry and consumers by all modes of transportation, including pipelines.

A leading energy infrastructure company affected by these regulations sought a records and information management service provider to assist them in completing a large scale compliance project to meet the requirements mandated by PHMSA.

## The Solution

With a proven track record in servicing the oil and gas industry, Information Network International proved to be a perfect match to fulfill the needs of the energy infrastructure organization.

To prepare for the task, consultants from Information Network International worked with the client's primary stakeholders to assess their needs, determine the desired project outcome, develop a timeframe, and create a weekly reporting system for tracking progress. To fulfill project requirements, Information Network International employed twenty-two record technicians to complete the following tasks:

- Identify, index, and scan hydrostatic tests stored in digital, microform, and physical formats
- Load and index pipeline integrity tracking information
- Update returned data and prep it for data system uploads

The client viewed the project's progress via *InSight* EveryWhere™ which is a secured web portal developed by Information Network International. The client was then able to provide reports generated through *InSight* EveryWhere as proof of compliant documentation.

## Results

Information Network International was able to index and validate thousands of tests, potentially saving the energy infrastructure organization tens of millions of dollars in excavation and retesting costs. As a result of providing staffing services and technological support, Information Network International successfully aided its energy infrastructure client in fulfilling their obligations to comply with PHMSA rules and regulations within a short timeframe.

*Information Network International helps pipeline company save tens of millions of dollars in excavation and retesting costs*

## Project Highlights

### Industry Served:

Energy infrastructure

### Project:

Index and catalog thousands of hydrostatic tests to comply with PHMSA regulations

### Project Length:

Two years

## About Information Network International

We build lasting partnerships with customers by working closely with them to identify, understand and resolve their records and information management issues.
